The Mayo Lung Project

A Perspective

Robert S. Fontana, M.D.

Department of Medicine, Mayo Clinic, Rochester, Minnesota.

BACKGROUND. The Mayo Lung Project (MLP) was a randomized, controlled, clinical trial designed to determine whether intensive radiologic and cytologic screening for lung carcinoma could reduce lung carcinoma mortality significantly.
METHODS. Half the MLP population was encouraged (and reminded) to undergo free chest X-rays and free sputum cytology tests every 4 months for 6 years,

Cancer, 2000

1971 – 1983
N = 9211 men, heavy smokers

Randomized:
- CxR + sputum q 4 months
- CxR + sputum annually

Screening by Chest Radiograph and Lung Cancer Mortality

The Prostate, Lung, Colorectal, and Ovarian (PLCO) Randomized Trial

Martin M. Oken, MD
Willam G. Hocking, MD
Paul A. Kvale, MD
Gerald L. Andriole, MD
Saundra S. Buys, MD

Context The effect on mortality of screening for lung cancer with modern chest radiographs is unknown.

Objective To evaluate the effect on mortality of screening for lung cancer using radiographs in the Prostate, Lung, Colorectal, and Ovarian (PLCO) Cancer Screening Trial.

Design, Setting, and Participants Randomized controlled trial that involved 154 901

JAMA, 2011

1993 – 2001

Early Lung Cancer Action Project: overall design and findings from baseline screening

Claudia I Henschke, Dorothy I McCauley, David F Yankelevitz, David P Naidich, Georgeann McGuinness, Olli S Miettinen, Daniel M Libby, Mark W Pasmantier, June Koizumi, Nasser K Altorki, James P Smith

Summary

Background The Early Lung Cancer Action Project (ELCAP) is designed to evaluate baseline and annual repeat screening by low-radiation-dose computed tomography (low-dose CT) in people at high risk of lung cancer. We report the baseline experience.

Methods ELCAP has enrolled 1000 symptom-free volunteers, aged 60 years or older, with at least 10 pack-years of cigarette smoking and no previous cancer, who were medically fit to undergo thoracic surgery. After a structured interview and informed consent, chest radiographs and low-dose CT were done for each participant. The diagnostic

Interpretation Low-dose CT can greatly improve the likelihood of detection of small non-calcified nodules, and thus of lung cancer at an earlier and potentially more curable stage. Although false-positive CT results are common, they can be managed with little use of invasive diagnostic procedures.

ABSTRACT Lung cancer screening is not established as a public health practice, yet the results of a recent large randomized controlled trial showed that screening with low-dose spiral computed tomography reduces lung cancer mortality. Using actuarial models, this study estimated the costs and benefits of annual lung cancer screening offered as a commercial insurance benefit in the high-risk US population ages 50–64. Assuming current commercial reimbursement rates for treatment, we found that screening would cost about $1 per insured member per

NCCN Guidelines - 2018

- Age 55 – 74 y, and
- ≥ 30 pack-year history of smoking, and
- Smoking cessation < 15 years

or

- Age > 50 y, and
- ≥ 20 pack-year history of smoking, and
- Additional risk factors*

** Risk factors*

- Personal cancer history
- Family history of lung cancer
- Chronic lung disease (COPD, ILD)
- Carcinogen exposure (Asbestos, radon, arsenic, etc.)

Screening for Lung Cancer: U.S. Preventive Services Task Force Recommendation Statement DRAFT

DRAFT

DRAFT

DRAFT

Summary of Recommendation and Evidence

DRAFT

The U.S. Preventive Services Task Force (USPSTF) recommends annual screening for lung cancer with low-dose computed tomography (LDCT) in persons at high risk for lung cancer based on age and smoking history.

DRAFT

This is a Grade B recommendation.

July 30, 2013

Annals of Internal Medicine | CLINICAL GUIDELINE

Screening for Lung Cancer: U.S. Preventive Services Task Force Recommendation Statement

Virginia A. Moyer, MD, MPH, on behalf of the U.S. Preventive Services Task Force*

Description: Update of the 2004 U.S. Preventive Services Task Force (USPSTF) recommendation on screening for lung cancer.

Methods: The USPSTF reviewed the evidence on the efficacy of low-dose computed tomography, chest radiography, and sputum cytologic evaluation for lung cancer screening in asymptomatic persons who are at average or high risk for lung cancer (current or former smokers) and the benefits and harms of these screening tests and of surgical resection of early-stage non–small cell lung cancer. The USPSTF also commissioned modeling studies to provide information about the optimum age at which to begin and end screening, the optimum screening interval, and the relative benefits and harms of different screening strategies.

Population: This recommendation applies to asymptomatic adults aged 55 to 80 years who have a 30 pack-year smoking history and currently smoke or have quit within the past 15 years.

Recommendation: The USPSTF recommends annual screening for lung cancer with low-dose computed tomography in adults aged 55 to 80 years who have a 30 pack-year smoking history and currently smoke or have quit within the past 15 years. Screening should be discontinued once a person has not smoked for 15 years or develops a health problem that substantially limits life expectancy or the ability or willingness to have curative lung surgery. (B recommendation)

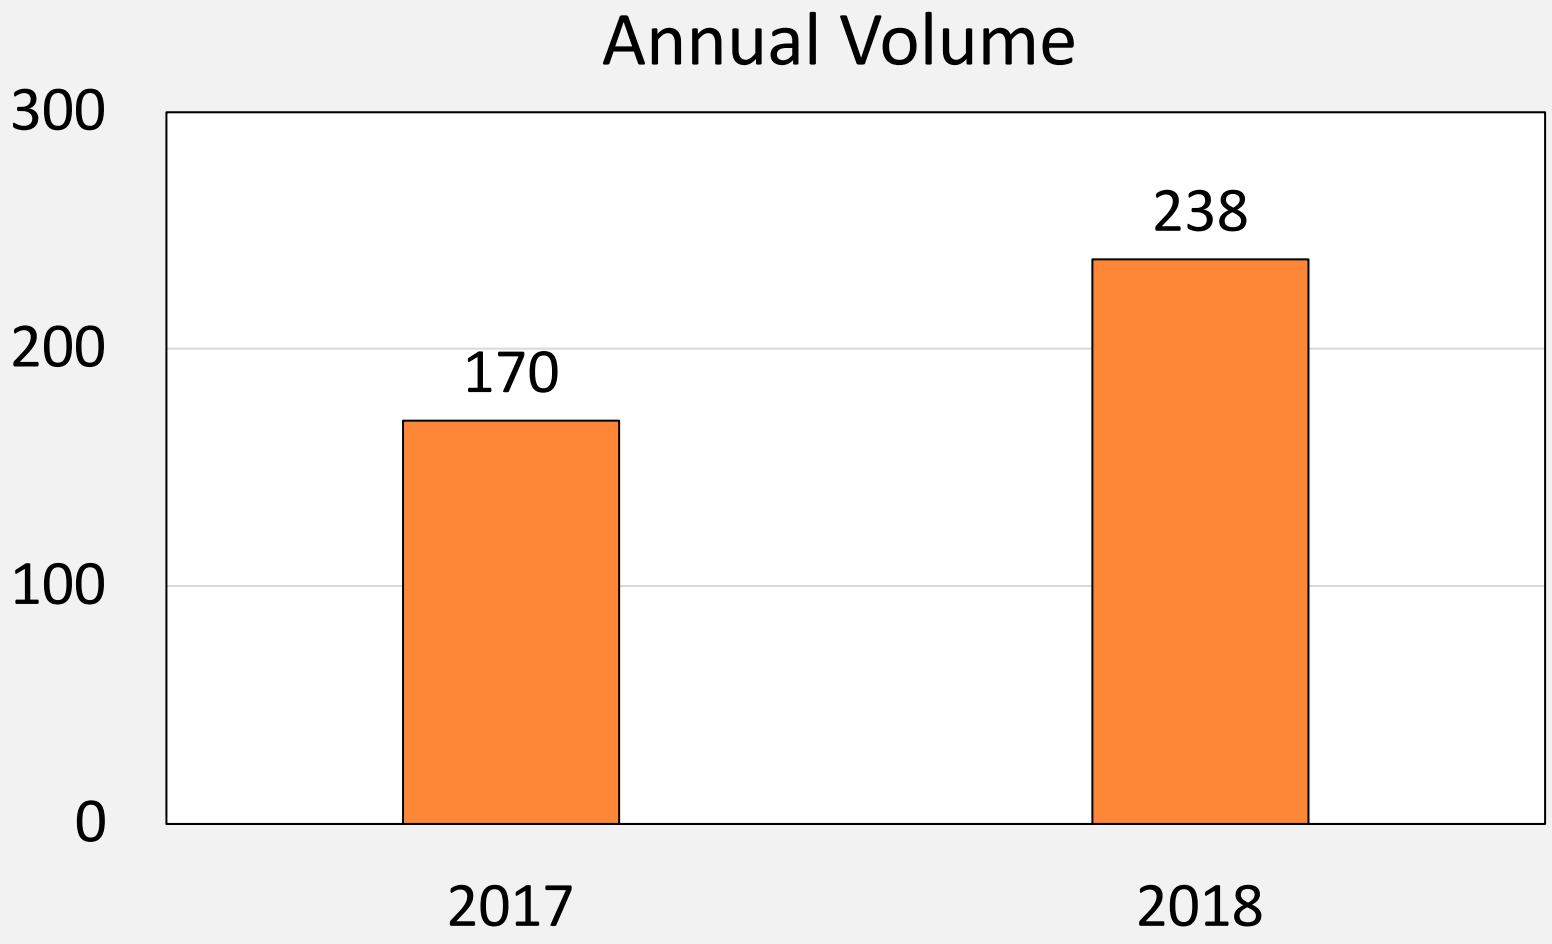
MHS Lung Cancer Screening Program

2013 – ACR Accreditation
2018 – Formal program launched

- FTE ARNP
- Shared decision making visit
- Letters to patients/physicians
- “Open” program

MHS Lung Cancer Screening Program



MHS Lung Cancer Screening Program

Interval	Lung-RADS 3	Lung-RADS 4	Positive Biopsy
10/2018 – 12/2018	4	6	2
1/2019 – 2/2019	4	3	

MHS Lung Cancer Screening Program

Challenges:

- Legal – HIPAA
- “Open” program makes management difficult

The bottom line….

Screening for lung cancer saves lives…

Needs to be done in a well-organized program, and

…along with smoking cessation.

"…the opportunity to realize the greatest single reduction of cancer mortality in the history of the war on cancer."
